

# WASP 4.0 Product Suite

Systinet WASP 4.0 is the industry's most advanced Web services solution. WASP provides everything you need to build, deploy, secure and manage Web Services.

WASP is a platform-independent, standards-compliant set of infrastructure products that offer excellent interoperability, scalability and extensibility. WASP Developer seamlessly extends popular IDEs to support Web services creation and debugging. WASP Server is a high-performance, secure, cross-platform Web services runtime environment, supporting both Java and C++. WASP UDDI is a V2 compliant registry designed for private use. Systinet WASP products are ideal for integrating existing enterprise applications, and for creating new, integration-ready applications.

*"Millions of users rely on, and pay for, Web services powered by Systinet."*

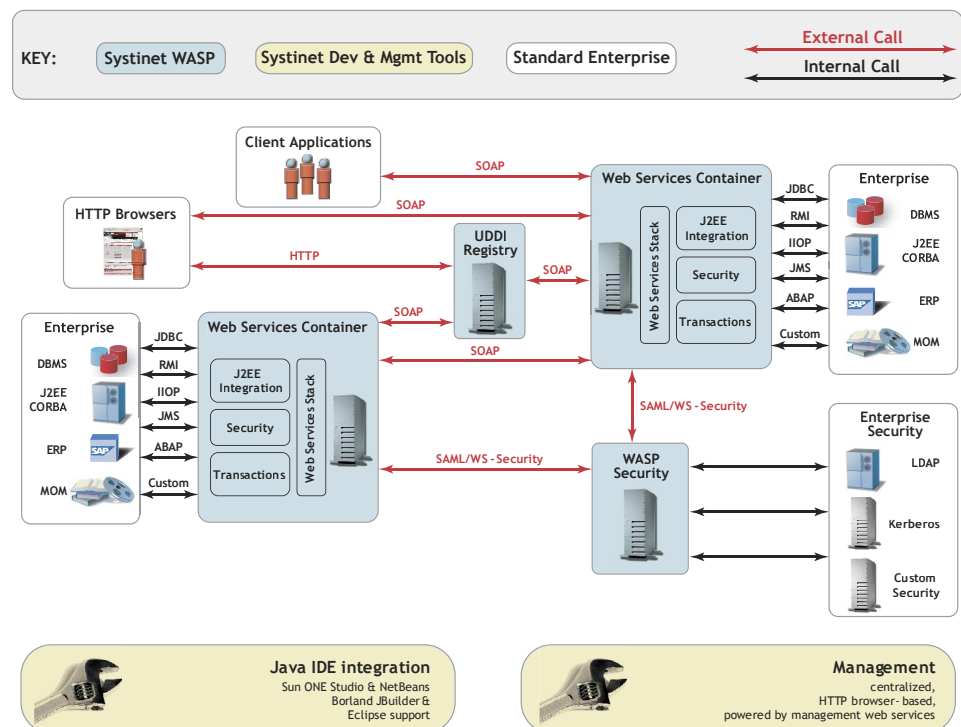

- The Patricia Seybold Group

## Main Features

### Systinet WASP 4.0:

- Complete Web Services Solution
  - WASP Developer
  - WASP Server for Java
  - WASP Server for C++
  - WASP UDDI
- 100% Standards Compatible
- Platform Independent Solution
- Excellent Interoperability
- Full Security & Management Framework
- Industry's Best Performance and Scalability

## Overview

The WASP Suite of products delivers on the promise of Web services by providing a industrial strength, portable, secure and standards-compliant solution that can easily solve otherwise complex application integration challenges. Web services should augment and unify an existing IT infrastructure: WASP works with any operating system, Web server, application server, database or development environment. WASP also has best-in-class interoperability with other Web services products such as Apache SOAP/Axis and Microsoft .NET. WASP 4.0 also provides powerful functionality for mission-critical applications, including a unified security and management framework.

## Features

Complete Web Services Solution

100% Compliance with Industry Standards

Platform Independence

Industrial Strength Technology

Ease of Use

Industry's Strongest Security Framework

Comprehensive Management Functionality

Free for Small Scale Deployments

## Benefits

WASP provides everything you need to build, deploy, secure and manage Web services.

Systinet WASP provides full support for the latest Web services technologies, including SOAP 1.1, SOAP 1.2, and WSDL 1.1. WASP also supports XML Signature and SAML. No other solution provides this level of standards support.

WASP works anywhere. It can be integrated with any operating system, Web server, application server, database, or development environment.

Systinet created the industry's first commercial SOAP implementation and is now providing its fourth generation product that offers the best performance, scalability, interoperability and extensibility on the market. WASP also provides failover and load balancing support. With hundreds of live deployments and many thousands of registered users, WASP provides a robust, field-tested solution.

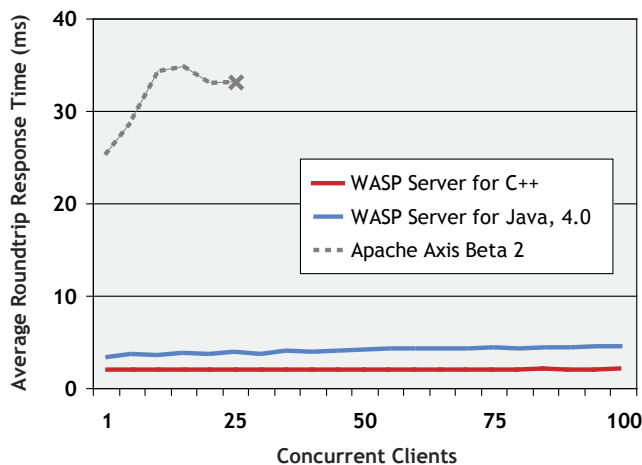

WASP Developer seamlessly extends popular IDEs and provides a point-and-click code generation experience for creating Web services, as well as powerful testing, debugging and deployment tools. WASP Developer supports Borland JBuilder, Sun ONE Studio (aka Sun Forte for Java and NetBeans), Eclipse, and IBM WebSphere Studio Application Developer.

WASP provides comprehensive, end-to-end Web services security that encompasses the transport, application, XML and Web services layers. WASP supports several authentication mechanisms, authorization and access control, confidentiality, proof of origin and delivery, and user management. The framework is designed to work seamlessly with existing security implementations.

WASP provides extensive management facilities. WASP Server has a browser-based management console that enables the administration, configuration and monitoring of entire Web services environments. WASP UDDI is a V2 compliant registry with powerful privacy features, and a taxonomy validation services.

WASP Server is free for end-user deployments on single-CPU systems, and WASP Developer is free for commercial use.

## Performance & Scalability

WASP Server for Java and WASP Server for C++ provide unrivalled performance and scalability.

## Supported Technologies

- WASP Developer IDE plug-ins for Borland JBuilder, Sun ONE Studio (including NetBeans), Eclipse and IBM WebSphere Studio Application Developer.
- WASP Server for Java and C++
- Support for all major operating systems, Web servers, J2EE application servers, and database systems
- Consult individual product datasheets for details

## About Systinet

Systinet provides Web Services infrastructure software. Our products make it easy for enterprises to build, deploy, secure and manage Web services.

The Systinet WASP suite of products is based on industry-standards such as XML, SOAP, WSDL and UDDI. WASP products are available for Java and C++, interoperate seamlessly with other Web services implementations such as .NET, and are portable across a wide variety of platforms and servers.

Systinet is a privately-held company with headquarters in Cambridge, Massachusetts.
